ROCKER

Once thought of as a powder-specific feature, K2 pioneered the use of rocker on all-mountain and piste skis, with the rest of the ski industry following in our footsteps. Today, almost all of our skis are built with rocker, with the height and length optimized on each model for maximum performance and enjoyment.

SPEED ROCKER - Short, low rise in the tip with camber throughout and a flat tail for quick turn initiation, precise steering, and maximum stability on groomed snow.

POWDER ROCKER - High and long rise in the tip, low camber underfoot, and a medium-height, long rise in the tail to maximize float in soft snow.

POWDER TWIN ROCKER - High and long rise in both the tip and tail for maximum float in soft snow.

ALL-TERRAIN ROCKER - Gradual rise in the tip for great versatility in all conditions, with a low, short rise in the tail for added control in variable snow.

ALL-TERRAIN TWIN ROCKER - gradual, extended rise in the tip and tail for added versatility and control in all conditions.

CATCH FREE ROCKER - Effortless turn initiation at slow to moderate speeds thanks to a medium-height, gradual rise in the tip and a low, gradual rise in the tail.

CORES

K2 uses a variety of wood species in our cores to fine-tune the performance characteristics of each ski.

ASPEN
Lightweight and resilient. Great all-around core material.

FIR
Energetic, tough, dense wood that absorbs impacts well.

BALSA
Ultra light and responsive, balsa is used in the core of our lightest touring ski, the Wayback 80.

PAULOWNIA
Lively, flexible wood with excellent strength-to-weight ratio.

MAPLE
Dense hardwood with excellent power transfer and stability.

DARK MATTER DAMPING

A polymeric damper sandwiched between two layers of high-modulus carbon strategically placed along the ski edge to eliminate high-frequency vibrations, providing drastically increased edge grip at high speeds.

TITANAL I-BEAM

Titanal runs tip to tail along the center of the ski, optimally shaped for stability and precision through the entire turn.

TI² I-BEAM

Built with 100% more metal than our proven Titanal I-Beam construction, Ti² I-Beam adds an additional sheet of metal on top of the ski core, providing the ultimate in stability, dampness, and precision when hitting top speeds on groomed snow.

CARBON I-BEAM

Full-length unidirectional carbon running from tip to tail, providing increased accuracy and energy along the entire length of the ski with a lighter, livelier feel than our Titanal I-Beam.

TORSION CONTROL DESIGN

Designed to enhance stability and control in all snow types, Torsion Control Design combines a progressive torsional flex with a balanced and even longitudinal profile. Torsionally stiffest in the forebody and center of the ski, then relaxing throughout the tail, K2 skis with TCD are characterized by precise, accurate turn initiation and smooth, consistent turn release. TCD can be found on Mindbender and Mindbender Alliance skis, utilizing either Titanal Y-Beam or Spectral Braid construction.

TITANAL Y-BEAM

TCD-optimized shape, placing Titanal directly over the edges in the forebody of the ski for powerful and consistent turn entry in variable and off-piste conditions. Underfoot, the Titanal spans the full width of the ski for maximum power transfer and control. In the tail, the Titanal narrows, tapering to allow the ski to break free on the back end of the turn while still remaining supportive.

SPECTRAL BRAID (MINDBENDER AND MINDBENDER ALLIANCE COLLECTIONS)

Another implementation of K2's Torsion Control Design, patent-pending Spectral Braid is a first-of-its-kind variable-angle fiber reinforcement that allows for precision-tuned torsion and flex by altering the fiber orientation along the length of the ski. Lively, energetic, and composed, skis with K2's Spectral Braid have stability and control in spades while remaining extremely maneuverable.

POWERWALL

Power transfer to the ski's edges is dramatically enhanced with oversized ABS sidewalls that are laminated and pocketed within the wood core in the midbody of the ski.

SLANTWALL

Adding a 30-degree angle to the sidewall in K2's Hybritech construction, Slantwall increases a ski's agility and responsiveness while maintaining accuracy and power.

SPECTRAL

SPECTRAL BRAID (RECKONER COLLECTION)

K2's patent-pending Spectral Braid makes another appearance in select models in the Reckoner collection. In this iteration, the tighter fiber angles are found in the midbody of the ski, with more open angles in the tip and tail. This allows for more playfulness and forgiveness in the ski's extremities while maintaining a stable and powerful feel underfoot.

DOUBLE BARREL

Dense fir core over the edges for power and impact resistance bonded with a lighter aspen center core for a lively, energetic feel.

CARBON BOOST

Longitudinal carbon stringers laid on top of the core for added pop and rebound.

T3 CONSTRUCTION

Titanal Touring Technology is based on the premise that going downhill is the priority. As with our high-end piste and freeride skis, we've incorporated Titanal laminates into the construction of our award-winning Wayback and Talkback skis. The weight of our touring skis speaks for itself, and we'll let the smile on your face at the bottom of the run speak to their downhill performance.

Ti SPYNE

Titanal laminate specifically developed for the Wayback and Talkback collections to increase predictability, stability, and damping on lightweight touring ski constructions.

CARBON OVERDRIVE

Unidirectional carbon fiber integrated into the layouts of our Wayback and Talkback touring skis to keep them light and responsive.

SNOPHOBIC TOPSHEET

Hydrophobic snow-shedding topsheet material that helps prevent snow buildup.

CORRECT FLEX

A proprietary process involving custom core profiling combined with a composite insert recessed within the top of the core in the midbody of the ski that ensures consistent flex characteristics across all lengths of a given model of ski.

TRIAXIAL BRAID

Patented process that interlocks strands of fiberglass around a milled wood core for pronounced torsional strength while retaining the superior flex patterns inherent in a wooden ski.

METAL LAMINATE

Metal laminate construction, denoted by "Ti" in a ski's model name, uses a custom-shaped sheet of Titanal in the ski's layout to provide a damp, precise, and accurate feel.

HYBRITECH

Sidewall construction underfoot blended with a cap construction in the tip and tail. The sidewall section gives the ski accuracy, power, and edge grip, while the cap construction regions reduce swing weight.

DURACAP

A molding process that envelops the core and internal materials with the top layer of the ski. Duracap skis are generally lighter and more forgiving than skis utilizing other construction methods.

TWINTech

A durable, full sidewall construction providing great edge feel and performance with added topsheet resistance to impact damage.
